

## Weekly meeting

At this week's meeting we thought about how we would like to proceed with the project. Where do we start? How do we proceed? What do we need to consider? We came to the conclusion that the sending and receiving of messages (server-client connection) is the engine of our project, i.e. the most important thing. So our first step was to understand how to implement this connection. We remembered that the client and server were made available to us. We looked at the code together and went through it all to get a clear picture. In the end, there were still a few things that were unclear, e.g. what kind of usage some things have. The next step was "learning by doing" we downloaded the code and tried out how the server and client are connected. We tried with simple commands to realise a server or to make a contact, with trying more and more questions came up and we decided to ask the questions so that we could make better progress at the next meeting.
